

Lithium battery packs with different capacities

Overview

A comprehensive guide to mixing different capacity lithium batteries. Dive into the crucial aspects of voltage, BMS, fuses, and more.

The total battery bank must be at the same voltage. You must create a separate system for different voltages if you have different voltage.

The BMS is responsible for managing the charge and discharge process, keeping each cell within safe operating limits, preventing.

When you connect your batteries in parallel, they must have the same state of charge before connecting them. Because the voltage level of a LiFePO4 battery is flat in the middle, I.

A fuse for each battery can prevent excessive current from damaging the battery or creating a safety hazard. The overcurrent protection for the BMS is not enough. You need a.

These packs are made of multiple Li-ion cells (like 18650 or 21700) connected in series and/or parallel to provide specific voltages and capacities. Whether you need a 7.4V, 11.1V, or 14.8V battery pack, understanding their structure, chemistry, and configuration is crucial.
